Points to Remember

- An equation involving trigonometric ratios of an angle is called a trigonometric identity if it is true for all values of the angle.
- Trigonometric identities

  (i) $\sin^2\theta + \cos^2\theta = 1$ (ii) $1 + \tan^2\theta = \sec^2\theta$ (iii) $1 + \cot^2\theta = \operatorname{cosec}^2\theta$
- The line of sight is the line drawn from the eye of an observer to the point in the object viewed by the observer.
- The angle of elevation of an object viewed is the angle formed by the line of sight with the horizontal when it is above the horizontal level.
- The angle of depression of an object viewed is the angle formed by the line of sight with the horizontal when it is below the horizontal level.
- The height or length of an object or distance between two distant objects can be determined with the help of trigonometric ratios.

ICT CORNER

ICT 6.1

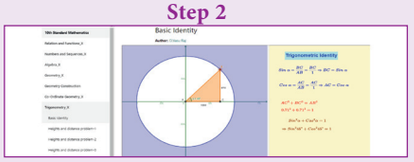

Step 1: Open the Browser type the URL Link given below (or) Scan the QR Code. Chapter named **"Trigonometry"** will open. Select the work sheet **"Basic Identity"**

Step 2: In the given worksheet you can change the triangle by dragging the point "B". Check the identity for each angle of the right angled triangle in the unit circle.

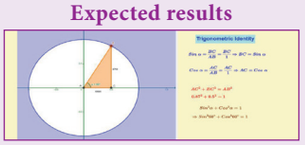

Step 1

Step 2

Expected results

ICT 6.2

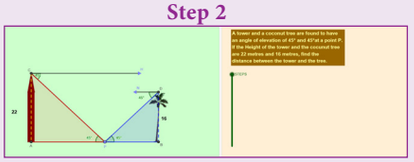

Step 1: Open the Browser type the URL Link given below (or) Scan the QR Code. Chapter named **"Trigonometry"** will open. Select the work sheet **"Heights and distance problem-1"**

Step 2: In the given worksheet you can change the Question by clicking on "New Problem". Move the slider, to view the steps. Workout the problem yourself and verify the answer.

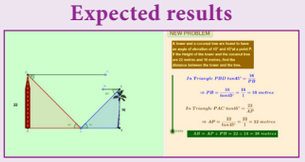

Step 1

Step 2

Expected results

You can repeat the same steps for other activities
